Recent very large scale galaxy surveys have now reached far enough out into our local volume to begin to see the end of greatness. That is they sample a large enough volume of space that the largest structures in the survey (about 100Mpc in size) are no longer of the same size of the survey itself.

The large-scale structure of homogeneous turbulence 583 which differs from the hitherto generally accepted form in which $E(K) \propto K^{-4}$ for small K . If the form (1.9) persists for all time, it is evident that the large-scale structure will differ in many ways. In particular, the energy in the final period of decay will decay like t^{-8} instead of t^{-8} .
